

Partners Platform

EXPLANATORY NOTE

The data shown in this file is an export of the information collected on the EVD Partners Platform ("Platform"). The data represents country/territory/area, regional or global information supporting the global coordination on the public health system response in the context of EVD in the AFRO region. The data presented are sourced from country/territory/areas government and by partner focal points. Financial contributions may be reported directly by registered donors/contributors. In addition, when publicity available, data may be collected and represented on the EVD Platform by WHO.

Transmission classification is self-reported by country/territory/area representatives and is included to provide a general indication on the current epidemiological situation of EVD affected and at risk countries. Information is aligned with weekly-published WHO situation reports. Capacity levels result from a broader country self-assessment aligned with the WHO SPAR (In full) benchmark.

Due to the dynamic nature of the EVD outbreak for affected and at risk country/territory/area with the high and moderate level of risk for neighbouring countries, consider the following three points regarding the information presented in this document:

1. The present data reflects available information at the moment of the data export from EVD affected and at risk country/territory/area – it may change as the epidemiological situation changes and as updated information is uploaded to the platform
2. The comprehensiveness of the data is dependent on the regular provision of information from country/territory/area representatives and donors – it must be understood that some information may, today, not be available on the Platform
3. The data presented here may also differ from, and should not be regarded as, the official national data of individual countries, territories/areas.

Version as of May 2021

Pillar 1: Coordination

Date: 23/07/2022 10:12:37

Assessor: (Super Admin)

Type: Inter Action Review

Affected Area and at Risk Area: Afghanistan

Transmission classification:

Actions to be taken in all national and subnational areas in all countries, national authorities and partners will:

	Yes (implemented)	No (not implemented)	Comments
The country has established (multi-sectoral) cholera focal points	✓		
The country has a national multisectoral coordination mechanism with clear terms of reference		✗	
The country has identified key performance indicators and monitoring of cholera response, including quality control mechanisms	✓		
National EOC with incident management system or national cholera task force in place		✗	
National cholera preparedness and response plan is updated and budgeted with clear needs.	✓		
Country has a long-term cholera elimination plan		✗	
Country has a resource mobilisation plan for cholera control and elimination (investment plan involving partners, government, etc.)	✓		
At-risk health districts have a multi-sectoral emergency coordination mechanism, with clear terms of reference and a designated coordinator and a contact list in place		✗	
There is an updated 4W of partners at national level	✓		
Country has conducted at least one simulation exercise to test its capacity to respond to epidemics including cholera (within the last 6 months)		✗
